[So What Next?](#)

[#1: Pick one process from this guide and build it yourself.](#)

[#2: Start thinking bigger about the systems inside your business.](#)

Who is this Guide for?

- You are a founder, operator or executive
- You already use AI for research or everyday work
- You have documents, reports, data or research scattered across different places

- You want AI to do more than simply summarize things
- You want to turn your existing information into useful work
- You want a simple way to use Gemini Notebook inside your actual business

Let's address the elephant in the room...

Is NotebookLM Actually That Different Now?

If you have used NotebookLM before?

You probably know it as the tool where you upload:

- PDFs
- Articles
- Documents
- YouTube videos
- Research

...and then ask AI questions about everything you uploaded.

It was great for summarizing information.

Finding answers.

Creating Audio Overviews.

And understanding large amounts of information without reading everything yourself.

But there was still one big limitation...

Most of the time?

NotebookLM helped you understand the work.

You still had to go somewhere else to actually DO the work.

You might research inside NotebookLM...

then open Excel to work with the numbers.

Then open PowerPoint to make the presentation.

Then open Docs to write the report.

Then move everything between all of those tools manually.

That's the part that has changed.

Google upgraded the system underneath NotebookLM with Gemini 3.5 and Antigravity.

Each notebook can now use a secure cloud computer that can write and run code, and Google says the system has more than 100 curated software skills available to it. (blog.google)

Which basically means?

NotebookLM can do much more than read your information back to you.

It can now help you:

- Research
- Analyze
- Calculate
- Create charts
- Build spreadsheets
- Create PowerPoints
- Create reports
- Work through complex projects
- Find new sources
- Turn your information into actual finished files

Google currently supports outputs including PDF, DOCX, CSV, JSON, Excel, PowerPoint and chart formats such as PNG and SVG.
(blog.google)

And one quick thing before we continue...

Google officially renamed NotebookLM to **Gemini Notebook** in July 2026.

You may still see “NotebookLM” in some places while the new name rolls out, but it is the same product. ([Google Workspace Updates](#))

So throughout this guide?

I'm going to call it **Gemini Notebook**.

Now...

Here is why I think this update matters for founders.

You can start with something messy like:

10 research reports.

3 spreadsheets.

A bunch of sales calls.

Your own notes.

Some competitor research.

And instead of simply asking:

"What does all of this say?"

You can work towards:

"What should I actually do with all of this?"

That is a much more useful question.

This guide will show you exactly how.

Here are the processes I'll show you:

1. Research a New Business Idea ⚡
2. Find Missing Research ⚡

3. Find Opposing Arguments ⚡
4. Analyze Your Own Business Data ⚡
5. Create PowerPoints ⚡
6. Create Excel Models ⚡
7. Create Finished Reports ⚡
8. Turn Company Knowledge Into SOPs ⚡
9. Analyze Sales Calls & Customers ⚡
10. Run the Entire Workflow From Start to Finish ⚡

And I'll give you plug and play prompts you can copy for every one.

But first...

The Two Key Steps Before Building Your First Notebook

There are two things I recommend you do BEFORE you start throwing documents into Gemini Notebook.

These sound simple.

But they'll make everything afterwards much easier.

Step #1: Give Every Notebook ONE Job

Do not create one notebook called:

"My Business"

and dump everything inside it.

Sales calls.

Marketing reports.

SOPs.

Random articles.

Financial data.

Competitor research.

Meeting notes.

Everything.

You'll end up with a giant pile of information without a clear goal.

Instead?

Build notebooks around one specific job.

For example:

Sales Call Intelligence

Q3 Marketing Performance

New Market Research

Customer Churn Analysis

Client Onboarding

Competitor Research

2027 Business Planning

New Product Research

This means everything inside the notebook is helping you answer one related group of questions.

The easiest way to think about this:

One Notebook = One Job

That's it.

Step #2: Decide What You Want at the End

Before you upload your first document?

Ask yourself:

What do I actually want Gemini Notebook to give me at the end of this?

Maybe you want:

- A recommendation
- A report
- A spreadsheet
- A presentation
- A financial model
- An SOP

- A strategy
- A decision
- A list of insights

This is important.

Because there is a big difference between saying:

“Research the US market.”

and saying:

“Help me decide whether our agency should enter the US market in the next 12 months.”

The second one gives Gemini Notebook an actual job.

So before you start?

Write down these four things:

What am I trying to figure out?

What information do I already have?

What information am I missing?

What do I want created at the end?

Once you know those?

You’re ready.

Now...

let's get into the specific ways you can use Gemini Notebook.

#1: Research a New Business Idea

Let's say you are thinking about launching a new offer.

Maybe you want to start selling AI automations to ecommerce businesses.

Normally?

You might open Google.

Search Reddit.

Read competitor websites.

Watch YouTube videos.

Save some PDFs.

Ask ChatGPT questions.

Write random notes.

And before you know it?

Your research is sitting in 15 different tabs.

Instead?

Create one Gemini Notebook for the idea.

Something like:

AI Automation Offer Research

Add everything you already have.

That could include:

- Your notes
- Customer calls
- Competitor information
- Industry research
- Articles
- Existing client feedback
- Market reports

Then ask Gemini Notebook to go through everything.

But here's where I would do something slightly different...

Don't immediately ask:

"Should I launch this?"

First ask:

"What do I actually know?"

Here is the prompt you can plug and play:

>> Copy this prompt

Review everything currently inside this notebook.

My objective is:

[INSERT WHAT YOU ARE TRYING TO FIGURE OUT]

Before giving me any recommendation, tell me:

1. What we currently know with reasonable confidence
2. What we are currently assuming
3. Which conclusions are supported by multiple sources
4. Where the sources disagree
5. What important information is currently missing
6. Which unanswered questions could materially change the final decision

Rank the missing information from most important to least important.

Do not give me the final recommendation yet.

I want to improve the research first.

This is important because AI loves giving you answers.

Even when you haven't given it enough information yet.

So instead of asking for the answer immediately?

Make it inspect the quality of your research first.

#2: Find What Your Research is Missing

This is one of my favorite parts of the new Gemini Notebook.

You don't necessarily need to find every source yourself anymore.

Google says Gemini Notebook can now help build out your source repository and use Google Search to locate relevant sources from the web. You still control which sources are added to your notebook. (blog.google)

So imagine your notebook already contains:

- Competitor research
- Market size
- Industry trends
- Pricing

Gemini Notebook reviews everything and realizes you have almost no information about:

- Customer willingness to pay
- Delivery costs
- Retention
- Implementation complexity

Those could completely change whether your idea is good or terrible.

So ask it:

>> Copy this prompt

Based on everything currently inside this notebook...

what important information are we still missing?

Separate the missing information into:

Critical

Information we should know before making the decision.

Important

Information that would increase our confidence.

Nice to Have

Information that is useful but unlikely to change the final decision.

For every gap:

- Explain what is missing
- Explain why it matters
- Tell me what question we need to answer
- Recommend the type of source that would give us the strongest evidence

Prioritize information that could actually change the decision.

Do not recommend more research simply for the sake of having more sources.

That last part matters.

You don't need 100 sources.

You need the information that actually helps you make the decision.

#3: Find the Opposing Argument

You know what's dangerous?

Researching an idea you already want to believe is true.

Let's say you believe:

"We should launch in the US."

So you collect:

- Positive US growth reports
- Competitor success stories
- Market size reports
- Articles talking about the opportunity

Then you ask AI:

"Should we launch in the US?"

Well...

you can probably guess what it is going to tell you.

You've basically created a confirmation bias machine.

So I recommend doing the opposite.

Make Gemini Notebook try to prove you wrong.

Here's the prompt:

>> Copy this prompt

Assume our current idea is wrong.

Our current hypothesis is:

[INSERT YOUR IDEA]

Build the strongest evidence-based argument AGAINST it.

Tell me:

1. The strongest evidence against the idea
2. The biggest assumptions we are currently making
3. The realistic situations where this could fail
4. What information we still do not know
5. What evidence would cause us to change our decision completely

Do not create weak counterarguments just to make the answer look balanced.

I want the strongest case possible against what we currently believe.

You can use this for:

- New offers

- Hiring
- Pricing
- Market expansion
- Partnerships
- Investments
- Software purchases
- New products
- Business strategy

Finding the problem before spending the money is always better than finding it afterwards.

#4: Analyze Your Own Business Data

Now this is where things start getting REALLY useful.

Gemini Notebook is no longer limited to other people's research.

You can bring in your own business data.

And because the upgraded system can run code, it can perform real analysis rather than simply looking at a table and describing it.
(blog.google)

Let's use a simple example.

You have:

File #1:

Your advertising spend.

And:

File #2:

Your sales data.

You want to know:

Which channels are actually making you money?

Normally?

Someone exports the data.

Cleans it.

Tries to match everything.

Builds formulas.

Creates charts.

Then writes the summary.

Instead, you can start by giving Gemini Notebook the raw files.

Then ask it to inspect them.

Here's the prompt:

>> Copy this prompt

Analyze the business data inside this notebook.

My objective is:

[INSERT WHAT YOU WANT TO UNDERSTAND]

Before doing the final analysis:

- Check for missing values
- Check for duplicated records
- Check for inconsistent naming
- Check whether dates match correctly
- Identify formatting problems
- Identify suspicious values
- Tell me if any of the datasets should NOT be directly compared

Do not silently remove questionable information.

Once you have checked the data, calculate where possible:

- Total spend
- Leads
- Customers
- Revenue
- Cost per lead
- Cost per customer
- Conversion rate

- Revenue compared to spend

Then tell me:

- Which areas are performing best
- Which areas are performing worst
- Anything unusual you found
- What opportunities you can see
- What problems I should investigate
- What decisions this data supports
- What decisions this data does NOT support

And show me how you reached the conclusions.

Think about how many ways you could use this.

Advertising.

Sales.

Revenue.

Expenses.

Customer retention.

Employee performance.

Inventory.

Website traffic.

Lead generation.

Almost any numbers you already keep.

#5: Create a PowerPoint From Your Research

Another part I really like?

You can now ask Gemini Notebook to create actual downloadable PowerPoint files. (blog.google)

So imagine you have spent the last hour researching a new market.

You have:

- Market size
- Competitors
- Pricing
- Risks
- Customer information
- Your own business data

Now you need to explain all of this to your team.

You could manually start making slides.

Or...

just give Gemini Notebook the job.

But don't say:

"Make me slides."

Be specific.

Here's the prompt:

>> Copy this prompt

Create a PowerPoint presentation using the information contained inside this notebook.

The presentation is for:

[INSERT WHO WILL SEE IT]

The decision they need to make is:

[INSERT DECISION]

Structure it like this:

1. Executive Summary
2. Current Situation
3. Key Findings
4. Important Numbers
5. Main Opportunity
6. Biggest Risks
7. Available Options
8. Recommended Option
9. Implementation Plan

10.Next Steps

Keep each slide focused on ONE major idea.

Do not fill the slides with unnecessary paragraphs.

Clearly separate facts from assumptions and recommendations.

Only use evidence contained inside this notebook.

The key here is telling Gemini Notebook:

Who is this for?

and...

What should they understand or decide afterwards?

That gives you a much stronger deck.

#6: Create an Excel Model From Your Data

Let's say you're thinking about launching a new service.

You know:

- What you want to charge
- What contractors cost
- Software costs
- Estimated customer acquisition cost

- Your current team capacity
- Estimated conversion rates
- Your expected churn

Now the important question is...

Does the idea actually make money?

Gemini Notebook can create downloadable Excel files as well.
(blog.google)

So you can ask it to turn all of those assumptions into a working model.

Here's the prompt:

>> Copy this prompt

Use the financial information contained in this notebook to create an Excel model.

Create separate sections for:

Inputs

All editable assumptions.

Revenue

Monthly projected revenue.

Fixed Costs

All recurring costs that do not change with customer volume.

Variable Costs

Costs that increase as the number of customers increases.

Unit Economics

Where the data allows, calculate:

- Gross margin
- Contribution margin
- Customer acquisition cost
- Customer lifetime value
- Payback period
- Revenue per customer

Then create three scenarios:

1. Conservative
2. Base
3. Aggressive

Clearly show what assumptions change in every scenario.

If any number is missing?

Do NOT invent it.

Mark it:

INPUT REQUIRED

At the end, tell me which assumptions have the biggest impact on profitability.

That last part is especially important.

Because sometimes one number changes everything.

Your acquisition cost might matter much more than your software costs.

Your churn might matter much more than the size of the market.

You want to know what the business model is actually sensitive to.

#7: Turn Your Research Into a Finished Report

Think about how often someone finishes analyzing something...
and then still spends another hour writing the report.

The analysis is already finished.

The charts already exist.

The conclusions are already clear.

But someone still has to package everything.

Gemini Notebook can now create downloadable PDF and DOCX documents as well. (blog.google)

Which means you can go directly from:

Research

to:

Analysis

to:

Finished Report

Here's the prompt:

>> Copy this prompt

Turn the completed research and analysis inside this notebook into an executive report.

The report is for:

[INSERT AUDIENCE]

The reader should be able to understand everything important without going through the original sources.

Structure it like this:

Executive Summary

Explain what happened, what matters and the biggest conclusion.

Key Numbers

Include only the numbers that matter to the decision.

Main Findings

Explain the strongest patterns from the research.

Business Impact

Explain what the findings actually mean for the company.

Recommended Actions

For every recommendation include:

- What we should do
- Why we should do it
- What evidence supports it
- Expected impact
- Any important risk

Limitations

Explain what information is missing or uncertain.

Next Steps

Tell us exactly what should happen next.

Avoid generic recommendations.

Every recommendation needs to connect back to information contained inside this notebook.

Now you've gone from:

A folder full of research...

to:

A finished document someone can actually read.

#8: Turn Messy Company Knowledge Into SOPs

This one is especially useful for businesses with teams.

Because most companies already have the information needed to build good SOPs.

The problem?

It's everywhere.

You might have the actual process sitting across:

- Slack conversations
- Google Docs
- Meeting transcripts
- Loom videos
- Old SOPs
- Project notes
- Messages
- Someone's head

So instead of asking AI:

“Write me an SOP for client onboarding.”

Do something much better.

Give Gemini Notebook the actual information about how your company works.

Then make it reconstruct the process first.

Here’s the prompt:

>> Copy this prompt

Analyze everything inside this notebook relating to:

[INSERT PROCESS]

First, reconstruct how the process CURRENTLY works.

Separate your findings into:

Documented Process

What our official documents say should happen.

Actual Process

What conversations, meetings and other information suggest really happens.

Contradictions

Where the documented process and actual process disagree.

Missing Steps

Things the team appears to do that are not documented.

Bottlenecks

Look for:

- Repeated manual tasks
- Duplicate work
- Waiting
- Approval delays
- Unclear ownership
- Repeated data entry
- Unnecessary handoffs

Then create an improved SOP containing:

1. Trigger
2. Owner
3. Required Inputs
4. Step-by-Step Process
5. Tools Used
6. Decision Points
7. Exceptions
8. Quality Checks
9. Completion Criteria

If you cannot determine something from the available information?

Do not invent it.

Mark it:

HUMAN INPUT REQUIRED

This is a much better way of building an SOP.

Because Gemini Notebook first understands what your team
ACTUALLY does.

Then helps you improve it.

#9: Analyze Sales Calls & Customer Research

Think about how many businesses record sales calls...
and then never use them again.

They sit inside:

Zoom.

tl;dv.

Fireflies.

Gong.

Drive.

Whatever.

Your team might have hundreds of hours of customer conversations.

That information is incredibly valuable.

Because customers are literally telling you:

- Why they buy
- Why they don't buy
- What they care about
- What confuses them
- What they are afraid of
- What alternatives they are considering

So create a notebook around those conversations.

For example:

Sales Call Intelligence

Then add:

- Closed-won calls
- Closed-lost calls
- Discovery calls
- Customer interviews
- CRM notes

Now ask:

>> Copy this prompt

Analyze the sales and customer conversations inside this notebook.

Compare CLOSED-WON conversations against CLOSED-LOST conversations.

Look specifically for differences in:

- Main problems mentioned
- Urgency
- Objections
- Pricing reactions
- Competitor mentions
- Decision-maker involvement
- Company size
- Desired outcomes
- Reasons for delaying
- Reasons for buying

Then tell me:

1. What patterns appear repeatedly in winning conversations?
2. What patterns appear repeatedly in losing conversations?

3. Which objections are actually hurting conversion?
4. Which objections appear but do NOT seem to stop people buying?
5. What language do customers repeatedly use to describe their problems?
6. What should our sales team do differently?
7. What should our marketing team learn from these calls?

Now your sales calls stop being recordings.

They become research.

#10: Chain Everything Into One Complete Workflow

This is probably the biggest lesson I want you to take from this guide.

Do not treat every Gemini Notebook feature separately.

The real value comes from chaining them together.

Let's use one example.

Imagine you want to answer:

Should we expand our company into the US?

Here's how I would use Gemini Notebook.

Step 1:

Add everything you already know.

- Current sales
- Customer information
- Margins
- Existing research
- Team capacity
- Strategy documents

Step 2:

Ask:

What do we currently know?

Step 3:

Ask:

What are we missing?

Step 4:

Let it help you research the gaps.

Step 5:

Ask it to build the strongest case AGAINST expansion.

Step 6:

Give it your own financial data.

Step 7:

Ask it to calculate whether the economics make sense.

Step 8:

Compare your options.

Maybe the answer isn't:

Expand

or:

Don't expand

Maybe you have:

Option A: Full expansion

Option B: Test one city

Option C: Find a local partner

Option D: Wait another six months

Step 9:

Ask Gemini Notebook for a recommendation.

Step 10:

Turn everything into:

- A financial spreadsheet
- An executive report
- A presentation
- An implementation plan

And that entire process happens with the same research and context feeding each step.

That's the difference.

Instead of:

Research in Google.

Numbers in Excel.

Thinking inside ChatGPT.

Slides inside PowerPoint.

Reports inside Docs.

You're bringing far more of that process into one place.

Google itself gives examples of this kind of chained workflow: research additional context, run code over data, create charts, and then produce a finished report from the same notebook.

(blog.google)

The 10 Plug and Play Prompts

Here they are again so you can easily grab them.

Prompt #1: Research Auditor

Review everything currently inside this notebook.

My objective is:

[INSERT OBJECTIVE]

Tell me:

- What we know
- What we are assuming
- Where sources agree
- Where sources disagree
- What information is missing
- Which unanswered questions could change the decision

Rank the missing information from most important to least important.

Do not give me the final recommendation yet.

Prompt #2: Missing Research Finder

Based on everything inside this notebook, tell me what important information we are still missing.

Separate it into:

Critical

Important

Nice to Have

For every gap, tell me:

- What is missing
- Why it matters
- What question needs answering
- What type of source would give us the strongest evidence

Prioritize information that could actually change the decision.

Prompt #3: Devil's Advocate

Assume this idea is wrong:

[INSERT IDEA]

Build the strongest evidence-based argument against it.

Tell me:

- Strongest evidence against it
- Biggest assumptions
- Realistic failure scenarios
- Missing information
- What evidence would completely change our decision

Do not create weak objections simply for balance.

Prompt #4: Business Data Analysis

Analyze the business data inside this notebook.

Before calculating anything:

- Check missing values
- Check duplicates
- Check inconsistent naming
- Check dates
- Identify formatting problems
- Identify suspicious values

Then calculate:

[INSERT METRICS]

Show me:

- Best-performing areas
- Worst-performing areas
- Important patterns
- Opportunities
- Problems
- Data limitations
- Decisions the data supports
- Decisions the data does NOT support

Prompt #5: PowerPoint Builder

Create a PowerPoint presentation from this notebook.

Audience:

[INSERT AUDIENCE]

Decision:

[INSERT DECISION]

Structure:

1. Executive Summary
2. Current Situation
3. Key Findings

4. Important Numbers
5. Opportunity
6. Risks
7. Options
8. Recommendation
9. Implementation
10. Next Steps

Keep every slide focused on one major idea.

Prompt #6: Excel Model

Create an Excel model using the financial information inside this notebook.

Include:

- Inputs
- Revenue
- Fixed Costs
- Variable Costs
- Unit Economics
- Conservative Scenario
- Base Scenario
- Aggressive Scenario

Do not invent missing numbers.

Mark missing information:

INPUT REQUIRED

Prompt #7: Executive Report

Turn the completed research and analysis into an executive report for:

[INSERT AUDIENCE]

Include:

- Executive Summary
- Key Numbers
- Main Findings
- Business Impact
- Recommendations
- Risks
- Limitations
- Next Steps

Every recommendation must connect back to evidence contained inside this notebook.

Prompt #8: SOP Builder

Analyze everything relating to:

[INSERT PROCESS]

Separate:

- Documented Process
- Actual Process
- Contradictions
- Missing Steps
- Bottlenecks

Then create an improved SOP containing:

Trigger

Owner

Inputs

Steps

Tools

Decisions

Exceptions

Quality Checks

Completion Criteria

Mark unresolved information:

HUMAN INPUT REQUIRED

Prompt #9: Sales Intelligence

Compare closed-won and closed-lost conversations.

Analyze:

- Problems
- Urgency
- Objections
- Pricing
- Competitors
- Decision-makers
- Desired outcomes

Tell me:

- What winning calls have in common
- What losing calls have in common
- Which objections matter most
- What our sales team should improve

- What our marketing team should learn

Prompt #10: Full Project Workflow

We are going to complete this project in stages.

Do NOT skip ahead.

Step 1: Review our current sources.

Step 2: Identify what is missing.

Step 3: Research the important gaps.

Step 4: Challenge our current belief.

Step 5: Analyze our internal data.

Step 6: Develop the conclusion.

Step 7: Create recommendations.

Step 8: Create the final files.

Our objective is:

[INSERT OBJECTIVE]

Start with Step 1 only.

The Results of Using Gemini Notebook Properly

You might be asking yourself:

What is the actual benefit of doing all of this?

Why not just keep using normal AI chats?

For me, the biggest difference is simple.

Your research stops being disconnected from the work you create afterwards.

The same information can help you:

- Understand a problem
- Research what you don't know
- Analyze your own data
- Challenge your assumptions
- Make a decision
- Build the spreadsheet
- Create the report
- Create the presentation

That's much more useful than asking AI random questions all day.

Especially if you already have a business full of:

Documents.

Calls.

Spreadsheets.

Reports.

Research.

SOPs.

Customer conversations.

You already have the knowledge.

The problem is usually making it useful.

So What Next?

You have 2 simple options:

#1: Pick one process from this guide and build it yourself.

Choose something you already do repeatedly.

Maybe:

Weekly reporting.

Research.

Sales analysis.

Client meeting preparation.

SOP creation.

Start with ONE notebook.

Add your existing information.

Use one of the prompts above.

See what comes back.

Improve it.

Then repeat.

You don't need to rebuild your whole business in one afternoon.

#2: Start thinking bigger about the systems inside your business.

Ask yourself:

What information does my team repeatedly gather?

What analysis do we repeatedly perform?

What documents do we repeatedly create?

What knowledge keeps getting lost?

Because once you identify those?

You're no longer talking about using another AI tool.

You're talking about building a better system for how your business works.

And that is exactly the type of work we build at DashboardLim™.

We help founders build dashboards, automations and AI systems that:

- Remove repetitive work
- Bring business information together
- Make reporting easier
- Capture company knowledge
- Give teams better visibility
- Help founders spend less time inside day-to-day operations

So if you want to build stronger systems inside your business, and you are skeptical of the value...

[Find out how other founders are winning with these systems.](#)
